Abstract	<p>*The dataset shows <i>Acacia mearnsii</i> - timber yield estimates allocated to mesozones. Yield estimates were derived from Schulze R.E. and Maharaj M. (2007) and then allocated to mesozones by combining with a base mesozone layer obtained from the CSIR Geospatial Analysis Platform (GAP).</p> <p>*The map of climatically optimum growth areas shows the main potential areas for <i>A. mearnsii</i> to be in a strip along the coast of the Eastern Cape, parts of the midlands and northwest of KwaZulu-Natal and a strip in Mpumalanga, with smaller patches of climatically optimum areas elsewhere.</p> <p>*Areas of highest yields of <i>A. mearnsii</i> timber correspond with those of bark, with significant tracts of the northeast of the Eastern Cape displaying considerable potential for future black wattle plantations.</p>
