Abstract	<p>*The data shows <i>Eucalyptus grandis</i> yield estimates allocated to mesozones. Yield estimates were derived from Schulze R.E. and Maharaj M. (2007) and then allocated to mesozones by combining with a base mesozone layer obtained from the CSIR Geospatial Analysis Platform (GAP).</p> <p>*<i>E. grandis</i> is native to the east coasts of Queensland and New South Wales in Australia, where it goes by the common name of Rose Gum (Meskimen and Francis, 2005). In its native habitat <i>E. grandis</i>, with its pronounced taproot, grows to 55 m in height on the lower slopes in well drained soils.</p> <p>Determination of Climatically Optimum Growth Areas of <i>E. grandis</i> have been defined in the ICFR's Forestry Toolbox (Kunz, 2004), by mean annual precipitation (MAP) and mean annual temperature (MAT).</p> <p>*<i>E. grandis</i> Yield Estimates Based on Smith's Rule-Based Approach Using Smith's (1994) rule-based approach for estimating MAIs of <i>E. grandis</i>, and considering only his climatic criteria and not soil or management factors.</p>
Keywords	agriculture, biomass, <i>eucalyptus grandis</i> , mesozones, yield estimation
